

PROMPT 1

Tasks to Complete

Each task must be completed using an iterative process involving LLM suggestions and your critical code review.

Task 1: Fix the Platform Underside Collision Snapping Bug

When jumping up through platforms, the player's feet prematurely snap to the top surface from below or clip through solid edges rather than passing cleanly through one-way ledges. Ensure landing resolution only triggers when the player is descending and strictly clears the platform's upper edge.

Task 2: Implement Crumbling Platform Hazards

Platforms remain permanently solid once stepped on, allowing players to stall without risk. Introduce fragile platforms that begin shaking and disintegrate shortly after the player lands on them, forcing constant upward mobility.

Task 3: Implement High-Velocity Spring Platforms

All platform surfaces currently provide identical standard bounce heights. Add distinct high-powered spring platforms that launch the player upward with bonus vertical velocity when touched.

Task 4: Implement a Rising Danger HUD & Lava Burst Surges

Players have limited visual notice of shifting lava ascent rates. Implement a danger meter tracking the speed of the rising lava, paired with periodic lava surge phases that briefly accelerate the liquid hazard upwards.

PROMPT 2

as you can see in this ss initially your character is not visible, make it so that dosent happen and also sometimes the platforming is actully impossible as the distance btw 2 platform is too high, fix that too
